

Public shop — where the data comes from

Customers see `autowagen-master/shop/` (no login). Everything they see is read from your **MySQL** database — mainly the **parts** table and links you maintain in the staff app.

1. Who enters what?

Customer sees	Staff enter here	Stored in database (concept)
Part title, price, stock count, photos	Inventory → Edit part	<code>parts</code> (+ <code>part_photos</code>)
“Engine” / category browsing	Same — Link EPC variant on the part	<code>part_epc_links</code> + <code>epc_*</code> tree
Whether it appears on the website at all	Tick List on public website on the part	<code>parts.list_online</code>
Buy online vs enquiry only	Source + condition (system rules)	<code>parts.source</code> , <code>parts.condition_grade</code>
Stripping stock (whole vehicles)	Master data → Vehicles + photos	<code>vehicles</code> , <code>vehicle_photos</code>
Guest messages	Customer fills Message on shop	<code>shop_guest_enquiries</code> (after SQL 06e)
Web orders WEB-...	Customer checkout	<code>shop_orders</code> , <code>shop_order_lines</code>

2. Checklist — put one part on the web

1. Log in to the staff site → **Inventory** → **Add part** (or edit an existing part).
2. Set **Part name** (this is what customers read — no need to put internal stock code in the title).
3. Set **Qty on hand**, **Status = Available**, **Asking price**.
4. In the **EPC** section, link the part to a variant under **Engine** (or another category) if you want it under that shop area.
5. Tick **List on public website** (**Stage 6b** — needs `sql/06b_web_shop.sql` applied once on the database).
6. Upload **photos** on the part if you can.
7. **Save**. Open the public **shop** in a private browser window and search or use **Browse parts / Engines**.

3. Engines menu — three “lanes” (optional)

The shop **Engines** dropdown splits listings using **words in the part name**. Staff should use clear, consistent titles.

Engine parts (loose) — ordinary spares (radiators, pumps, etc.). Avoid assembly phrases in the name.

Complete engines / sub-units — include phrases like: *complete engine, long block, long motor, full engine, engine assembly, sub unit*.

Cylinder heads / bare — include phrases like: *cylinder head, cyl head, bare head, head bare*.

Rules are defined in code: `includes/shop_helpers.php` → functions `shop_normalize_engine_line / shop_engine_line_sql_condition`. For a stricter system later, a dedicated field on `parts` could be added — speak to your developer.

4. Internal stock codes (SKU)

Staff still use **SKU** in **Inventory** (e.g. `AWG-0002-P01`, `OEM-0004`). The public shop **hides SKU from customers** on listing and detail pages; it remains in the database for invoices, orders, and staff search.

5. Databases: local vs live

- **Laragon (PC):** database name is usually `autowagen_master` — for testing.
- **Hosting:** same PHP code, but **your host's** database name and `config/secrets.live.php`. Data entered on the PC does **not** sync automatically to the website — export/import or re-enter on live when you go live.

6. SQL you may need (once per database)

- `sql/06b_web_shop.sql` — public shop columns + order tables.
- `sql/06e_shop_guest_enquiries.sql` — guest **Message** inbox.
- Stage 2 EPC + `epc_full_view` — needed for engine category browsing.
