

AUTOWAGEN MASTER

Git & GitHub — session handout (hard-copy / PDF)

Date (session): 2026-05-01 — **Purpose:** remember what Git/GitHub did for Autowagen Master and how to repeat it.

1. WHAT GIT + GITHUB DO FOR YOU

- **Git** (on your PC) keeps snapshots of your code in the folder `C:\laragon\www\autowagen-master`.
- **GitHub** (website) holds a backup copy online when you run **push**.
- Editing files in Cursor and saving works on your disk **immediately** for Laragon testing. **GitHub does not update by itself.**
- Password files and uploads are skipped by design — see project `.gitignore` (secrets + uploads/ contents).

2. YOUR GITHUB REPOSITORY

URL: `https://github.com/Hassan1970/autowagen-master`

Remote name: `origin` · **Branch:** `main`

You completed: first commit message `Initial import Autowagen Master`, then push so the repo is no longer empty.

3. WHERE TO TYPE GIT COMMANDS

1. Open **Windows PowerShell**, or Cursor menu **Terminal** → **New Terminal** (`Ctrl` + ```).
2. Always start in the project folder:

```
cd C:\laragon\www\autowagen-master
```

3. Do **not** paste commands into GitHub's search bar, phpMyAdmin, or inside a PHP file — only into the terminal.

4. ONE-TIME SETUP (ALREADY DONE ONCE — KEEP FOR REFERENCE)

If you clone this repo on a new PC in future, repeat these concepts; on this machine they are finished.

1. Create an empty repo on GitHub (**Hassan1970/autowagen-master**).
2. In the folder: `git init`
3. Set identity (once): `git config user.name "..."` and `git config user.email "..."`
4. Link remote (**full line — do not paste the URL alone**):

```
git remote add origin https://github.com/Hassan1970/autowagen-master.git
```

5. Rename branch: `git branch -M main`

6. Stage → commit → first push.

5. EVERY DAY — WHEN YOU WANT GITHUB UPDATED

Run these three commands in order (after `cd` to the project):

```
git add .  
git commit -m "Short description of what changed"  
git push
```

Change the message each time inside the quotes.

6. MISTAKES WE FIXED — QUICK REMINDERS

- Pasting only `https://github.com/Hassan1970/autowagen-master` into PowerShell caused an error. You must run `git remote add origin ...` as a whole line.
- Running bare `git commit` (no `-m`) opened **Vim**. Press `Esc`, type `:q!`, press `Enter` to quit without committing, then use `git commit -m "Your message"` instead.
- The number `14,1` in Vim was only the cursor line — not a problem with your files.

7. PC RESTART & NEW CURSOR CHATS

- After reboot: **Git stays installed**; the `.git` folder stays in the project; you do **not** redo `git init` unless you delete that folder.
- A **new AI chat** does not remove Git — it is only a new conversation.
- A **brand-new different project** would need its own `git init` (or `git clone`) and maybe a new GitHub repo.

8. OPTIONAL NEXT STEPS (NOT URGENT)

- On GitHub: **Settings** → **Change repository visibility** → **Private** (recommended for business code).
- Folder **TEST AUTOWAGEN WEBDESIGN** was mixed into the first commit; you can clean it from Git later with help if you want a smaller repo.
- **Live hosting** is separate: upload files or `git pull` on the server — GitHub does not replace your host.

File on disk: `docs/git_github_handout_print.html` — open in Chrome/Edge, print to PDF, or print on paper.
