

Autowagen Master — **Accounts receivable** report & **customer statement**

Plain-English walkthrough of each area on the two screens (matches **Reports** → **Accounts receivable** and the printable **statement**). Save as PDF: Ctrl + P → **Save as PDF**. File: docs/ar_report_and_customer_statement_explained_print.html

A. “Customer receivables” report (customer_ar_report.php)

You open this from the black top menu: **Reports** → **Accounts receivable (owed)**. It answers: *which customers still owe us money on final sales invoices?* It does **not** list money you owe suppliers (that is **Reports** → **Accounts payable**).

A1 — Grey box: “Credit notes — locked rules”

This is a short reminder of how **credit notes** affect the numbers (after sql/07_credit_notes.sql is applied):

- The **Balance** column is **net due**: what the customer still owes on that invoice after normal payments and after *all* finalized credits (both types below).
- **Formula (per invoice)**: Invoice total (incl. VAT) – Sum(payments) – Sum(finalized credit notes on that invoice)
- **AR cr.** and **Refund** (or **Refund cn.** on some screens) only **split** the credit-note total into two buckets so your books can tell a story:

AR reduction credits add to the **AR cr.** column total.

Cash refund credits add to the **Refund** column total.

Both types still reduce **Balance** the same way — the split does not invent a second, different balance.

If you see **R 0.00** in AR cr. and Refund, that usually means no finalized credit notes exist for those invoices yet — not that the feature is broken.

A2 — Grey box: “Two different reports”

This stops the common confusion between:

- **This page**: money **customers owe you** (sales / POS).
- **Accounts payable**: money **you owe suppliers** (inventory purchases). Different menu, different data.

A3 — Grey line: “Overdue” definition

Overdue here means: the invoice has a meaningful **due date**, that date is *before* the report’s **As at** date, and there is still a positive balance. Invoices **without** a due date still show in totals and balances, but they are not flagged as overdue on this logic.

A4 — Filter row: date, ticks, Apply, buttons

- **As at** — calendar date (“pretend today is ...”). Due dates are compared to this when deciding overdue portions.
- **Overdue only** — narrows lists to balances that qualify as overdue as at that date.

- **Account customers only** — only customers flagged as account customers on their record (requires Stage 6a SQL). Useful when you mainly sell “on account” to a subset.
- **Apply** — reloads the report with your filters.
- **Print / PDF** — hides navigation for a cleaner print or saved PDF.
- **Sales invoices** — shortcut to the invoice list (`invoices_admin.php`), not AR math.

A5 — Summary strip (black bar + red side card)

- **Total owed (listed customers)** — sum of positive **net due** balances for everyone who appeared in the **By customer** table under your filters.
- **Of which overdue** — sum of balance amounts that fall on overdue invoices only (still using the rules in A3).

A6 — Section: “BY CUSTOMER”

One row per customer who has outstanding balance (under your filters). Columns:

- **Customer** — name on file.
- **Account** — shows an “Account” badge if that customer is an account customer.
- **Phone** — contact if stored.
- **Balance** — that customer’s total **net due** across all their open final invoices.
- **AR cr.** — total of finalized **AR reduction** credit-note amounts attached to *their* invoices (classification only).
- **Refund** — total of finalized **cash refund** credits on those invoices.
- **Overdue** — portion of their balance counted as overdue (see A3).
- **Statement / Customer** — open printable statement or customer edit.

A7 — Section: “BY INVOICE (open balance)”

One row per **final** invoice that still has money owed (positive net due). Columns:

- **Invoice** — e.g. **INV-2026-00002**.
- **Customer** — buyer.
- **Inv date** — invoice date.
- **Due date** — for on-account; “—” or empty if none set.
- **Status** — badge like **Overdue Nd, Open, No due date** — quick read of timing.
- **Balance** — **net due** on this invoice alone.
- **AR cr.** — sum of finalized AR-reduction credits for this invoice; shows “—” or R 0.00 when none.
- **Refund cn.** — sum of finalized cash-refund credits; “—” or R 0.00 when none.
- **Open** — jump to invoice in POS (`invoice_edit.php`).

B. Customer account statement (customer_statement.php)

This is a printable “letter-style” overview for **one customer**. Typical ways to open it: next to their name on the **Customers** list, link from AR report **Statement**, or direct URL ?id= with their customer ID.

B1 — Title block

- **Statement date:** the “as at” calendar date printed on the statement (Johannesburg). May differ slightly from invoice dates inside the grid.
- **Currency ZAR, VAT as per invoices** — amounts follow what was finalized on each invoice.

B2 — “Bill to” card

Name, optional billing address, phone, email, and optionally an “Account customer” badge — exactly what will print on PDF for the buyer.

B3 — “Amount outstanding” (dark box)

Single headline number: sum of **Balance** on all listed invoice rows below that still have something due (normally excludes invoices fully paid/zero balance unless you chose to include settled ones).

B4 — Toolbar: date, checkbox, Apply, buttons

- **Statement as at** — adjusts which overdue styling might apply vs that date.
- **Include paid-in-full** — when ticked and applied, invoices with **R 0.00** balance can appear too (history).
- **Print / PDF** — save a formal attachment.
- **WhatsApp** — opens WhatsApp Web/app with a *short text summary* (not full letterhead).
- **Email** — mailto:; opens Outlook/Thunderbird etc. with pasted summary text — still not automatic server email.
- **Edit customer / AR report** — shortcuts.

B5 — Grey explanatory box (credit notes + sending)

Repeats in customer language:

Balance = total – paid – **all** finalized credits.

AR cr. and **Refund cn.** show how much credit was labelled each way.

Full line-level detail stays on each **credit note** and **invoice**.

Also warns that SMTP (automatic email from the server) is **not** wired yet — Email button is desktop mail.

B6 — Invoices table

- **Invoice / Date / Due** — identity and timing.
- **Total** — invoice total incl. VAT.
- **Paid** — payments recorded against that invoice.
- **AR cr.** — finalized AR-reduction credits for that invoice (R 0.00 when none).
- **Refund cn.** — finalized cash-refund credits for that invoice (R 0.00 when none).

- **Balance** — remaining customer obligation on that invoice = same net rule as the AR report row for that INV.
- **Open** — drill into invoice screen.

Foot row **Total outstanding** should match or align with the dark summary box when filters match.

B7 — “Recent payments received” (if shown)

List of payment lines tied to invoices for this customer (most recent first, capped). Good for callers asking “did you allocate my EFT?” — paired with invoices above.

Why both screens?

The **AR report** is operational: whom to chase, overdue focus, totals across everyone.

The **statement** is relational: send to one customer showing their invoices + split credit columns without logging into back-office jargon.
