

AUTOWAGEN MASTER — session report

Topic: **Reports** top navigation · Database impact · Viewer login · Next step (single path)

1 — Summary (what changed)

A new **Reports** dropdown was added to the black staff top bar in `includes/header.php`. It groups list/report-style screens in one place. Items that were duplicated under **Inventory** or **POS** were removed from those menus so there is a single obvious path for report-style pages.

2 — Database / SQL on live server

No new tables and no ALTER statements were shipped for this change. Live behaviour is updated by deploying the updated **PHP** (and optional HTML docs) only. Your MySQL schema is unchanged *by this Reports-menu work*.

If you use **guest web shop messages** (`shop_enquiries_admin.php`), that feature still needs `sql/06e_shop_guest_enquiries.sql` run once per database — that is separate from the Reports menu and was not part of this nav change.

3 — Reports submenu (current build)

Submenu item	Target	Who sees it
Accounts payable (owed)	<code>supplier_ap_report.php</code>	owner, admin, manager, staff
Accounts receivable (owed)	<code>customer_ar_report.php</code>	all logged-in roles
Sales invoices	<code>invoices_admin.php</code>	all logged-in roles
Customer statements (Customers list)	<code>customers_admin.php</code>	all logged-in roles (open Statement on a row)
Web shop orders	<code>shop_orders_admin.php</code>	owner, admin, manager, staff
Web shop messages (guest enquiries)	<code>shop_enquiries_admin.php</code>	owner, admin, manager, staff

Inventory now focuses on parts, public shop links, add part, and supplier purchases. **POS** keeps **Sales invoices** and **New sale** (staff+).

4 — Where this is documented in the repo

- `docs/CHANGELOG.md` and `docs/CHANGELOG.html` — dated entry *Reports menu in top nav*

- CLAUDE.md — section 2 (Stage 6 nav note), section 9 (session log), section 10 (UI table)
- docs/complete_system_manual.html — section 2 menu map and cross-references
- docs/reports_staff_guide_print.html — click paths for staff PDF training
- ROADMAP.md — AP path wording

5 — How to log in as viewer

Roles live in the `users` table (`role` enum includes `viewer`). There is no separate “viewer login page” — same `auth/login.php` as everyone else; the role comes from the row for that username.

Option A — New user (phpMyAdmin)

1. Open phpMyAdmin → database `autowagen_master` (or your live DB name) → table `users` → **Insert**.
2. Set **username** (unique), **full_name**, leave **email** null or unique, set **role** = `viewer` , **is_active** = `1` .
3. For **password_hash** you must store a **PHP** `password_hash` value (not plain text). On a PC with PHP: run

```
php -r "echo password_hash('YourPasswordHere', PASSWORD_DEFAULT);"
```

Copy the full hash string into the **password_hash** column, then save the row.

4. Log out of Autowagen if needed → open login URL → sign in with that username/password. Your name badge should show **viewer**.

Option B — Temporarily downgrade an existing user (testing only)

1. phpMyAdmin → `users` → **Edit** the row → set **role** to `viewer` → Go.
2. Log in as that user. (Remember to set the role back when finished testing.)

6 — Features *not* built (clarification)

Customer returns / credit notes, supplier returns, automated **sales analytics PDF** from the app, and similar items remain **out of MVP** unless you schedule a dedicated build. The Reports menu only reorganizes existing pages; it does not add returns or a new sales report module.

7 — Single recommended next step (one path)

1. **Deploy + verify**: On the live site, upload or pull the current code, open the app, confirm **Reports** appears and each submenu link loads; confirm you did **not** need to run any SQL for this nav change alone.
