

GIT — Laragon terminal · start to finish

Autowagen Master · `C:\laragon\www\autowagen-master` · GitHub HTTPS + token · UTC+2

PART A — OPEN THE TERMINAL

1. **Laragon:** Right-click the Laragon tray elephant → **Terminal** or open **Cmder** if you use it.
2. **Cursor:** Menu **Terminal** → **New Terminal** or press `Ctrl` + ``` (backtick).
3. **Go to the project folder** (type exactly, then Enter):

```
cd C:\laragon\www\autowagen-master
```

4. **Check you are in Git:**

```
git status
```

If you see branch name + file list → OK. If **not a git repository** → wrong folder; fix the cd path.

PART B — SAVE WORK ON GITHUB (EVERY SESSION YOU CARE ABOUT)

Three commands in order: **stage** → **commit** → **push**.

1. **Stage everything** (all saved files in the folder):

```
git add .
```

2. **Commit** with message on the same line (avoids Vim opening):

```
git commit -m "Short plain English: what you changed"
```

If it says **nothing to commit, working tree clean** → there were no new changes since last commit (still run git push if unsure).

3. **Push** to GitHub:

```
git push
```

PART C — FIRST TIME GIT ASKS FOR LOGIN (HTTPS)

Prompt	What to type
Username	Your GitHub username (same as in <code>github.com/yourname/...</code>).
Password	Not your GitHub website password. Use a Personal Access Token (next section).

PART D — CREATE A PERSONAL ACCESS TOKEN (ONCE PER TOKEN)

1. Browser → GitHub → profile photo → **Settings** → **Developer settings** → **Personal access tokens** → **Tokens (classic)** → **Generate new token (classic)**.
2. **Note:** any **unique** label (e.g. Laragon May 2026). If GitHub says **Note has already been taken**, change the text.
3. Tick scope **repo** (full control of private repositories).
4. **Generate token** → copy the token (`ghp_...`). Store it safely — GitHub shows it once.
5. **Never** paste the token into chat or screenshots.

PART E — IF PUSH FAILS

Message	What it means / fix
Password authentication is not supported / Invalid username or token	Use token as password, not site password. Or generate new token.

Everything up-to-date	Remote already has your commits. If you expected new files → run <code>git status</code> ; if files listed → do Part B (add, commit, then push).
Git keeps wrong password	Windows Credential Manager → Windows Credentials → remove <code>git:https://github.com</code> → <code>git push</code> again → username + token.

PART F — IF VIM OPENS AFTER GIT COMMIT

You ran `git commit` without `-m "..."`. Options:

- **Abort commit:** `Esc` then type `:q!` `Enter`.
- **Finish commit:** `i`, type message line, `Esc`, `:wq` `Enter`.

Habit: always use `git commit -m "your message"` so Vim does not open.

PART G — QUICK CHECKLIST (COPY RHYTHM)

```
cd C:\laragon\www\autowagen-master
git status
git add .
git commit -m "Describe today's changes"
git push
git status ← should say working tree clean
```

WHAT GIT DOES NOT BACKUP

- **MySQL database** — export with phpMyAdmin separately.
- Files listed in `.gitignore` (e.g. local secrets, most of uploads/) — by design.
