

SESSION RECAP — Valatone local DB · SaaS Option A

Cursor session notes · Printable → PDF · Africa/Johannesburg UTC+2 · dated 2026-05-05

1 · Goal (what “today” covered)

- Work inside the **Valatone / SaaS** project copy (workspace `valaotne-saas`) with a **dedicated database** `valatone_master` — **not** the live Autowagen `autowagen_master` unless you consciously share it.
- Run the standard **SQL ladder** so POS, shop, AR, credit notes, etc. exist as **tables** on this DB.
- Lock in **SaaS Option A**: each new paying yard later gets its **own database + secrets + deploy** — see provisioning handout linked in section 6.

2 · Database work you completed

- **Stage 1** · `01_auth.sql` · `users` , `user_login_attempts` .
- **Stage 2 EPC** · `02_epc.sql` (six `epc_*` tables + `epc_full_view`). With **12** rows in `epc_categories` , expansion `02b` (or equivalent) looks applied — `02c` – `02h` remain **optional** catalogue depth.
- **Stage 3** · `03_master_data.sql` · vehicles, customers, suppliers, vehicle–EPC links. Then `03b` , `03c` , `03d` .
- **3c tip**: if phpMyAdmin showed **#1305**, cause was corrupted text `TABLE_SCHEMADATABASE()` — correct line is `TABLE_SCHEMA = DATABASE()` .
- **Stage 4** · `04_inventory.sql` · `04b` · **`04c_supplier_purchases.sql` only** (skip `04c_tpp_intake.sql` — deprecated pointer file) · `04d` .
- **Stages 5–7** · `05_pos.sql` · `06a` , `06b` , `06e` · `07_credit_notes.sql` .

Note: Empty row counts (`0`) on transactional tables mean **no data yet**, not that SQL scripts failed.

3 · Config & first login

- `config/secrets.local.php` — `db.name = valatone_master` (example); `app.url` must match the real browser URL and folder under Laragon (`../valaotne-saas/` vs typos).
- **No “Users screen” yet** — first staff row is inserted in phpMyAdmin into `users` with a **bcrypt** `password_hash` · `role owner` · `is_active = 1` .
- Helper on disk: `tools/generate_password_hash.php` (run with Laragon’s `php.exe`). Full illustrated guide remains `docs/add_users_staff_guide_print.html` .

4 · Docs & tools added during this arc

- `docs/saas_option_a_new_customer_checklist_print.html` — Option A onboarding (DB + secrets + SQL order + worksheet).
- `tools/generate_password_hash.php` — CLI bcrypt for new passwords.
- Cross-links · `docs/client_training_index.html` · `docs/VALATONE_SAAS_WAY_FORWARD.md` Phase 1a · `CHANGELOG` + `CLAUDE.md` §9 entries for the SaaS checklist work.

5 · Immediate “what’s next”

1. Confirm **one user row** exists on `valatone_master` (Browse · `users`).
2. Open **login** URL that matches `secrets.local.php` (`auth/login.php`).
3. Smoke-test: **Dashboard** → optional master data · **POS** draft · guest `/shop/` .
4. For every **new customer** (Option A): use `saas_option_a_new_customer_checklist_print.html` Print → PDF as the run-sheet.

6 · Related PDF-style pages (already in `docs/`)

- **Provisioning**: `saas_option_a_new_customer_checklist_print.html`
- **Add users / hashes**: `add_users_staff_guide_print.html`
- **DB incremental vs replace**: `database_update_backup_guide_print.html`
- **New PC install**: `client_install_print.html`
- **SaaS strategy (Markdown)**: `VALATONE_SAAS_WAY_FORWARD.md`

This recap is narrative only — not SQL. Canonical SQL path in repo root `CLAUDE.md` §10. Index of handouts: `docs/client_training_index.html` .
