

## OPTION A — New customer (one tenant = one database)

Valatone SaaS provisioning · repeatable manual checklist · timezone Africa/Johannesburg UTC+2 · pair with [ONE VALATONE SaaS WAY FORWARD.pdf](#)

**What Option A is:** Each yard gets its **own** MySQL database, its **own** secrets.\*.php , and its **own** deployed folder/subdomain. No shared multi-tenant table — isolation is by separate DB.

**Never** point two customers at the same database name. **Never** reuse another client's FTP path unless you intentionally overwrote them (don't).

### PER CUSTOMER — DO IN ORDER

1. **Record** (write on this sheet footer or your CRM): company name · planned URL/subdomain · **DB name** · DB user · provision date · who ran the checklist.
2. **Create an empty database** on the server (hosting control panel or phpMyAdmin) with UTF-8 (utf8mb4). Example name pattern: `yard_slug_master` — unique per customer.
3. **Create MySQL user** granted only that database — not global `root` on production.
4. **Deploy PHP files** to this customer's directory (FTP, git deploy, ZIP). Same codebase version as your gold master.
5. **Secrets file on the server:** `config/secrets.live.php` — set `db.name` , `db.user` , `db.pass` , `db.host` , and `app.url` to their **exact** public base URL (trailing slash rule = match whatever the app expects). Never commit secrets to Git.
6. **Run SQL migrations on this database only** — phpMyAdmin → pick **that** DB → SQL tab → paste file contents → Go. Use the table in the next section **in order**. Skip a file only if you are absolutely sure it already ran on this DB.
7. **First login user:** insert one row into `users` with a `bcrypt password_hash` , `role owner` — full steps:  
`docs/add_users_staff_guide_print.html` .
8. **Smoke test:** open their URL → login → Dashboard · create one test vehicle or part (optional) · open POS draft · open public `/shop/` (if used) · Reports menu loads.
9. **Handoff:** give the customer their login URL + username reset policy; keep your copy of DB name and deploy path.

### SQL SEQUENCE (FRESH EMPTY DATABASE)

Each row = one file under `sql/` . Paste whole file unless your process uses CLI. Yellow #1681 "display width" warnings are usually harmless.

| ☐ | File                              | Notes                                                                                                                  |
|---|-----------------------------------|------------------------------------------------------------------------------------------------------------------------|
|   | 01_auth.sql                       | <code>users</code> , login attempts                                                                                    |
|   | 02_epc.sql                        | EPC tables + starter tree                                                                                              |
|   | 02b ... 02h (optional)            | Bigger catalogue — only if you standardise expanded EPC for all tenants; see <code>sql/README_EPC_EXPANSION.txt</code> |
|   | 03_master_data.sql                | Vehicles, customers, suppliers                                                                                         |
|   | 03b_vehicle_extras.sql            |                                                                                                                        |
|   | 03c_proof_of_residence.sql        | Uses <code>TABLE_SCHEMA = DATABASE()</code> guards                                                                     |
|   | 03d_customer_compliance.sql       |                                                                                                                        |
|   | 04_inventory.sql                  | Parts                                                                                                                  |
|   | 04b_part_tpp_compliance.sql       |                                                                                                                        |
|   | 04c_supplier_purchases.sql        | <b>Not</b> <code>04c_tpp_intake.sql</code> — that file is a pointer only                                               |
|   | 04d_supplier_accounts_payable.sql | Bills + supplier payments                                                                                              |
|   | 05_pos.sql                        | Invoices                                                                                                               |
|   | 06a_customer_account.sql          | On-account customers / AR UX                                                                                           |
|   | 06b_web_shop.sql                  | Shop tables + <code>list_online</code>                                                                                 |

| <input type="checkbox"/> | File                         | Notes            |
|--------------------------|------------------------------|------------------|
|                          | 06e_shop_guest_enquiries.sql | After <b>06b</b> |
|                          | 07_credit_notes.sql          | After <b>05</b>  |

## LARAGON (LOCAL TRIAL COPY FOR ONE CUSTOMER)

- Copy project to a folder · create local DB · config/secrets.local.php → dbname + app.url (e.g. <http://localhost/customer-folder/> ).
- Same SQL order as above.

## CUSTOMER WORKSHEET (HANDWRITING)

Customer / company: \_\_\_\_\_ Date: \_\_\_\_\_ Tech initials: \_\_\_\_\_  
Public URL: \_\_\_\_\_  
Database name: \_\_\_\_\_ DB user: \_\_\_\_\_  
Deploy folder on host (path): \_\_\_\_\_  
Git tag / ZIP version deployed: \_\_\_\_\_
